## DETAILED ACTION

### *Response to Arguments*

1. Applicant's arguments filed 11 September 2007, with respect to the rejections of the claims under 35 USC § 103(a) have been fully considered and are persuasive. The rejections of the claims under 35 USC § 103(a) have been withdrawn. Applicant's present amendments to the claims overcome the previously cited prior art references. Further, Examiner has not uncovered any additional prior art which anticipated and/or renders obvious the present claims.

### *Allowable Subject Matter*

2. **Claims 37-39 and 49-41 are allowed.**

The following is an examiner's statement of reasons for allowance:

Independent claim 37 recites a scanning apparatus which adjusts the reference levels between a plurality of output channels. The plurality of output channels are calibrated with respect to each other by (1) selecting the maximum of the output values from the plurality of output channels when the image sensor reads a white reference member, and (2) selecting the minimum of the output values from the plurality of output channels when the image sensor reads a reference density member having a predetermined density of halftone. Reference values are set based on the maximum and minimum determined output values. An example of this is shown in figure 11a of the present application, which sets an input/output curve based on the thus determined minimum and maximum values.

Examiner has not discovered prior art which anticipates claim 37 or renders claim 37 obvious to one of ordinary skill in the art at the time of the invention. The closest prior art is Orito (USPN 6,072,912) which reads a plurality of white levels (figure 8 of Orito) and a plurality of black levels (figure 9 of Orito) in order to calibrate the image levels for image data scanning. The maximum and minimum values are discarded and an average value obtained for the white and black references levels (column 8, lines 48-57 of Orito), which is in direct contrast with the present invention. Further, as is normal in the prior art, the individual channels are corrected separately, rather than as in the present invention wherein calibration data is used across the plurality of output channels in order to determine an overall calibration. Thus, claim 37 is deemed allowable over the prior art.

Claims 38, 39 and 49-61 depend from claim 37, either directly or indirectly, and thus incorporate all of the limitations of claim 37. Accordingly, claims 38, 39 and 49-61 are also deemed allowable over the prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
